

VirtoSIS fully software-based Intercom Server function

Picture shows third party public server infrastructure, which may be loaded with VirtoSIS software package in order to create an intercom/video system

The virtuoSIS is world's first fully software-based Intercom Server, designed specifically to embrace the flexible, dynamic sphere of virtual IT environments. It is here that the new Software Intercom Server shows its true talents and great benefits: same functionality as its hardware-based cousins at remarkably low investment and operating costs.

Embedded into the virtual server infrastructures, the server can take advantage of the usual extra-high backup and security mechanisms. This automatically ensures the essential high availability.

Its purpose: providing voice and video Intercom where and when it counts, using latest virtual machine technology; to make complex voice and video connections easy to use, so users can become real virtuosos of their Intercom systems for more

- * Simplicity: full functionality only a few clicks away.
- * Availability: support of leading fail safety features of virtual platforms.
- * Flexibility: scalable, cost efficient licensing options to suit every need.
- * Efficiency: world's first true convergence of Intercom and IT.
